### Sample mean and variance.

Let  $(X_n, X)$  be a sequence of square integrable independent and identically distributed random variables with  $\mathbb{E}[X] = m$ ,  $Var(X) = \sigma^2$ . The **sample mean** and the **sample variance** are defined by

and  

$$\overline{X}_n = \frac{1}{n} \sum_{k=1}^n X_k,$$

$$S_n^2 = \frac{1}{n} \sum_{k=1}^n (X_k - \overline{X}_n)^2.$$

ĉ

#### Goal

Recursively estime the unknown mean and variance

$$\theta = \begin{pmatrix} \boldsymbol{m} \\ \sigma^2 \end{pmatrix}.$$

### Two recursive equations.

We have

$$(n+1)\overline{X}_{n+1}=\sum_{k=1}^n X_k+X_{n+1}.$$

Consequently,

$$(n+1)\overline{X}_{n+1} = n\overline{X}_n + X_{n+1} = (n+1)\overline{X}_n + X_{n+1} - \overline{X}_n$$

which implies that

$$\overline{X}_{n+1} = \overline{X}_n + \frac{1}{n+1} \Big( X_{n+1} - \overline{X}_n \Big).$$

( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( ) < ( )

### A recursive matrix equation.

Denote

$$\widehat{\theta}_n = \begin{pmatrix} \overline{\mathbf{X}}_n \\ \mathbf{S}_n^2 \end{pmatrix}.$$

It follows from the previous calculation that

$$\widehat{\theta}_{n+1} = \widehat{\theta}_n + \frac{1}{n+1}F(\widehat{\theta}_n, X_{n+1}) + \frac{1}{(n+1)}r_{n+1}$$

where

and

$$r_{n+1} = \begin{pmatrix} 0 \\ -\frac{1}{(n+1)} (X_{n+1} - \overline{X}_n)^2 \end{pmatrix}.$$

4 ≥ + < ≥ +</p>

### A recursive matrix equation.

However,

$$\mathbb{E}[\boldsymbol{F}(\widehat{\theta}_n, \boldsymbol{X_{n+1}}) | \boldsymbol{\mathcal{F}_n}] = \boldsymbol{f}(\widehat{\theta}_n) + \boldsymbol{s_n}$$

where  $f(\hat{\theta}_n) = \theta - \hat{\theta}_n$  and

$$s_n = \begin{pmatrix} 0 \\ \left(m - \overline{X}_n\right)^2 \end{pmatrix}$$

Consequently, we obtain the martingale decomposition

$$\hat{\theta}_{n+1} = \hat{\theta}_n + \frac{1}{n+1} \left( f(\hat{\theta}_n) + \varepsilon_{n+1} + R_{n+1} \right)$$

where  $(\varepsilon_n)$  is a martingale difference sequence,  $\mathbb{E}[\varepsilon_{n+1}|\mathcal{F}_n] = 0$  and the remainder  $R_{n+1} = r_{n+1} + s_n$  is negligeable.

### A first warm-up result.

#### Theorem

Assume that  $(X_n, X)$  is a sequence of iid random variables such that  $\mathbb{E}[X^4]$  is finite. Denote  $\mathbb{E}[(X - m)^3] = \mu^3$  and  $\mathbb{E}[(X - m)^4] = \tau^4$ . Then, we have the almost sure convergence

$$\lim_{n\to\infty}\widehat{\theta}_n=\theta\qquad\text{a.s.}$$

In addition, we also have the asymptotic normality

$$\sqrt{n} \left( \widehat{\theta}_n - \theta \right) \stackrel{\mathcal{L}}{\longrightarrow} \mathcal{N}(\mathbf{0}, \Gamma)$$

#### where

$$\mathsf{\Gamma} = \begin{pmatrix} \sigma^2 & \mu^3 \\ \mu^3 & \tau^4 - \sigma^4 \end{pmatrix}.$$

### Quantile of a continuous distribution.

Let X be a **continuous** random variable with **unknown** distribution function F. Assume that F is **continuous and strictly increasing**.

#### Definition

For any  $\alpha$  in ]0, 1[, the quantile of order  $\alpha$  of X is the unique solution  $\theta_{\alpha}$  of the equation  $F(x) = \alpha$ ,

 $F(\theta_{\alpha}) = \alpha.$ 

For the Exponential  $\mathcal{E}(\lambda)$  distribution with  $\lambda > 0$ ,

$$\theta_{\alpha} = -\frac{1}{\lambda}\log(1-\alpha).$$

#### Goal

 $\longrightarrow$  Recursively estime the unknown quantile  $\theta_{\alpha}$ .

**Bernard Bercu** 

Stochastic algorithms with statistical applications

### Outline

- Sample mean and variance.
- Recursive estimation of mean and variance.
- Quantile of a continuous distribution.
- Recursive estimation of quantile.

### Convergence of martingales

- Definition and Examples.
- On Doob's convergence theorem.
- Square integrable martingales.
- Robbins-Siegmund theorem.
- Strong law of large numbers for martingales.
- Central limit theorem for martingales.

Let  $(X_n)$  be a sequence of **iid** random variables sharing the same distribution as *X*. We estimate  $\theta_{\alpha}$  by the recursive estimator

$$\widehat{\theta}_{n+1} = \widehat{\theta}_n - \frac{1}{n+1} \Big( Y_{n+1} - \alpha \Big)$$

where

$$\mathbf{Y}_{n+1} = \mathbf{F}(\widehat{\theta}_n, \mathbf{X}_{n+1}) = \mathbf{I}_{\{\mathbf{X}_{n+1} \leqslant \widehat{\theta}_n\}}.$$

We clearly have  $\mathbb{E}[Y_{n+1}|\mathcal{F}_n] = F(\hat{\theta}_n)$  leading to the martingale decomposition

$$\hat{\theta}_{n+1} = \hat{\theta}_n - \frac{1}{n+1} \left( F(\hat{\theta}_n) + \varepsilon_{n+1} - \alpha \right)$$

where  $(\varepsilon_n)$  is a martingale difference sequence,  $\mathbb{E}[\varepsilon_{n+1}|\mathcal{F}_n]=0$ .

### A second warm-up result.

Denote by f the probability density function of X.

#### Theorem

We have the almost sure convergence

$$\lim_{n\to\infty}\widehat{\theta}_n=\theta_\alpha\qquad\text{a.s.}$$

Moreover, as soon as  $f(\theta_{\alpha}) > 1/2$ , we have the asymptotic normality

$$\sqrt{n}\Big(\widehat{\theta}_n - \theta_{\alpha}\Big) \xrightarrow{\mathcal{L}} \mathcal{N}\Big(\mathbf{0}, \frac{\alpha(\mathbf{1} - \alpha)}{\mathbf{2f}(\theta_{\alpha}) - \mathbf{1}}\Big).$$

< 回 > < 回 > < 回 >

### A second warm-up result.

Consider the slow down Robbins-Monro algorithm given by

$$\widehat{\theta}_{n+1} = \widehat{\theta}_n - \gamma_n \Big( Y_{n+1} - \alpha \Big)$$

where

$$\gamma_n = rac{1}{n^c}$$
 with  $rac{1}{2} < c < 1.$ 

At time  $n \ge 1$ , compute de Cesaro mean

$$\overline{\theta}_n = \frac{1}{n} \sum_{k=1}^n \widehat{\theta}_k.$$

### Doob's convergence theorem.

#### Theorem (Doob)

Let  $(M_n)$  be a MG, sMG, or SMG bounded in  $\mathbb{L}^1$  which means

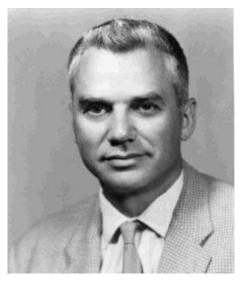

# $\sup_{n\geq 0}\mathbb{E}[|M_n|]<+\infty.$

Then, we have the almost sure convergence

 $\lim_{n\to\infty}M_n=M_\infty \qquad a.s.$ 

where  $M_{\infty}$  is an integrable random variable.

### Convergence of martingales.

#### Theorem

Let  $(M_n)$  be a MG bounded in  $\mathbb{L}^p$  with  $p \ge 1$ , which means that

 $\sup_{n\geq 0}\mathbb{E}[|M_n|^p]<+\infty.$ 

- If p > 1, (M<sub>n</sub>) converges almost surely to an integrable random variable M<sub>∞</sub>. The convergence is also true in L<sup>p</sup>.
- If p = 1, (M<sub>n</sub>) converges almost surely to an integrable random variable M<sub>∞</sub>. The convergence holds in L<sup>1</sup> as soon as (M<sub>n</sub>) is uniformly integrable that is

$$\lim_{a\to\infty}\sup_{n\geq 0}\mathbb{E}\big[|M_n|\mathbf{I}_{\{|M_n|\geq a\}}\big]=0.$$

### Chow's Theorem.

Theorem (Chow)

Let  $(M_n)$  be a MG such that for  $1 \leq a \leq 2$  and for all  $n \geq 1$ ,

 $\mathbb{E}[|M_n|^a] < \infty.$ 

Denote, for all  $n \ge 1$ ,  $\Delta M_n = M_n - M_{n-1}$  and assume that

$$\sum_{n=1}^{\infty} \mathbb{E}[|\Delta M_n|^a | \mathcal{F}_{n-1}] < \infty \qquad a.s.$$

Then, we have the almost sure convergence

 $\lim_{n\to\infty}M_n=M_\infty \qquad a.s.$ 

where  $M_{\infty}$  is an integrable random variable.

**Bernard Bercu** 

# Exponential Martingale.

#### Example (Exponential Martingale)

Let  $(X_n)$  be a sequence of independent random variable sharing the same  $\mathcal{N}(0, 1)$  distribution. For all  $t \in \mathbb{R}^*$ , let  $S_n = X_1 + \cdots + X_n$  and denote

$$M_n(t) = \exp\Big(tS_n - \frac{nt^2}{2}\Big).$$

It is clear that  $(M_n(t))$  is a **MG** which converges a.s. to zero. However,  $\mathbb{E}[M_n(t)] = \mathbb{E}[M_1(t)] = 1$ . It means that  $(M_n(t))$  does not converge in  $\mathbb{L}^1$ .

### Autoregressive Martingale.

#### Example (Autoregressive Martingale)

Let  $(X_n)$  be the autoregressive process given for all  $n \ge 0$  by

$$\boldsymbol{X}_{n+1} = \boldsymbol{\theta} \boldsymbol{X}_n + (1-\boldsymbol{\theta})\boldsymbol{\varepsilon}_{n+1}$$

where the initial state  $X_0 = p$ ,  $0 and the parameter <math>0 < \theta < 1$ . Assume that  $\mathcal{L}(\varepsilon_{n+1}|\mathcal{F}_n)$  is the Bernoulli  $\mathcal{B}(X_n)$  distribution. We can show that  $0 < X_n < 1$  and that  $(X_n)$  is a **MG** satisfying

$$\lim_{n\to\infty}X_n=X_\infty$$
 a.s.

The convergence also holds in  $\mathbb{L}^r$  for all  $r \ge 1$ . Finally, we can prove that  $X_{\infty}$  has the Bernoulli  $\mathcal{B}(p)$  distribution.

### Increasing process.

#### Definition

Let  $(M_n)$  be a square integrable **MG** that is for all  $n \ge 1$ ,

 $\mathbb{E}[M_n^2] < \infty.$ 

The **increasing process** associated with  $(M_n)$  is given by  $\langle M \rangle_0 = 0$  and, for all  $n \ge 1$ ,

$$< M >_n = \sum_{k=1}^n \mathbb{E}[\Delta M_k^2 | \mathcal{F}_{k-1}]$$

where  $\Delta M_k = M_k - M_{k-1}$ .

#### Example (Increasing Process)

Let  $(X_n)$  be a sequence of square integrable and independent random variables such that, for all  $n \ge 1$ ,  $\mathbb{E}[X_n] = m$  and  $Var(X_n) = \sigma^2 > 0$ . Denote

$$M_n=\sum_{k=1}^n(X_k-m).$$

Then,  $(M_n)$  is a martingale and its increasing process reduces to

$$< M >_n = \sigma^2 n.$$

Convergence of martingales

Strong law of large numbers for martingales.

### Strong law of large numbers for martingales.

Theorem (Strong Law of large numbers)

Let  $(M_n)$  be a square integrable MG and denote

$$< M >_{\infty} = \lim_{n \to \infty} < M >_n$$
.

**1** Assume that  $< M >_{\infty} < \infty$  a.s. Then, we have

 $\lim_{n\to\infty}M_n=M_\infty\qquad a.s.$ 

2 Assume that  $< M >_{\infty} = \infty$  a.s. Then, we have

$$\lim_{n\to\infty}\frac{M_n}{_n}=0 \qquad a.s.$$

 $\longrightarrow$  If it exists a positive sequence  $(a_n)$  increasing to infinity such that  $< M >_n = 0(a_n)$  a.s., then we have  $M_n = o(a_n)$  a.s.

## Strong law of large numbers for martingales, continued

#### Theorem (Strong Law of large numbers)

Let  $(M_n)$  be a square integrable MG such that

$$\lim_{n\to\infty} < M >_n = \infty \qquad a.s.$$

• For any positive  $\gamma$ , we have

$$\frac{M_n^2}{<\boldsymbol{M}>_n} = \boldsymbol{o}\left(\left(\log <\boldsymbol{M}>_n\right)^{1+\gamma}\right) \qquad a.s$$

If the increments of  $(M_n)$  have conditional moments of order > 2,

$$\frac{M_n^2}{_n} = O\left(\log _n\right) \qquad a.s.$$

< 回 > < 回 > < 回

### Example on sums.

Let  $(X_n)$  be a sequence of square integrable and independent random variables such that, for all  $n \ge 1$ ,  $\mathbb{E}[X_n] = m$  and  $Var(X_n) = \sigma^2 > 0$ . We already saw that

$$M_n = \sum_{k=1}^n (X_k - m)$$

is square integrable **MG** with  $\langle M \rangle_n = \sigma^2 n$ . It follows from the **SLLN** for martingales that  $M_n = o(n)$  a.s. which means that

$$\lim_{n\to\infty}\frac{1}{n}\sum_{k=1}^n X_k = m \qquad \text{a.s.}$$

More precisely, for any positive  $\gamma$ ,

$$\left(\frac{M_n}{n}\right)^2 = \left(\frac{1}{n}\sum_{k=1}^n X_k - m\right)^2 = o\left(\frac{(\log n)^{1+\gamma}}{n}\right) \qquad \text{a.s.}$$

## Central limit theorem for martingales.

#### Theorem (Central Limit Theorem)

Let  $(M_n)$  be a square integrable **MG** and let  $(a_n)$  be a sequence of positive real numbers increasing to infinity. Assume that

**1** It exists a deterministic limit  $L \ge 0$  such that

$$\frac{\langle M\rangle_n}{a_n} \xrightarrow{\mathcal{P}} L.$$

**3** Lindeberg's condition. For all positive  $\varepsilon$ ,

$$\frac{1}{a_n}\sum_{k=1}^n \mathbb{E}[|\Delta M_k|^2 \mathrm{I}_{\{|\Delta M_k| \ge \varepsilon \sqrt{a_n}\}} | \mathcal{F}_{k-1}] \stackrel{\mathcal{P}}{\longrightarrow} 0$$

where  $\Delta M_k = M_k - M_{k-1}$ .

< 回 > < 回 > < 回 >

# Central limit theorem for martingales.

#### Theorem (Central Limit Theorem)

Let  $(M_n)$  be a square integrable **MG** and let  $(a_n)$  be a sequence of positive real numbers increasing to infinity. Assume that

**1** It exists a deterministic limit  $L \ge 0$  such that

$$\frac{\langle M\rangle_n}{a_n} \xrightarrow{\mathcal{P}} L.$$

### **2** Lindeberg's condition. For all positive $\varepsilon$ ,

$$\frac{1}{a_n}\sum_{k=1}^n \mathbb{E}[|\Delta M_k|^2 \mathrm{I}_{\{|\Delta M_k| \ge \varepsilon \sqrt{a_n}\}} | \mathcal{F}_{k-1}] \stackrel{\mathcal{P}}{\longrightarrow} 0$$

where  $\Delta M_k = M_k - M_{k-1}$ .

< 回 > < 回 > < 回 >

Convergence of martingales

Central limit theorem for martingales.

## Central limit theorem fro martingales, continued.

#### Theorem (Central Limit Theorem)

Then, we have the asymptotic normality

$$\frac{1}{\sqrt{a_n}}M_n \stackrel{\mathcal{L}}{\longrightarrow} \mathcal{N}(0,L).$$

Moreover, if L > 0, we also have

$$\sqrt{a_n} \Big( \frac{M_n}{\langle M \rangle_n} \Big) \stackrel{\mathcal{L}}{\longrightarrow} \mathcal{N}(0, L^{-1}).$$

 $\rightarrow$  Lyapunov's condition implies Lindeberg's condition : For **b > 2**,

$$\sum_{k=1}^{n} \mathbb{E}[|\Delta M_k|^b | \mathcal{F}_{k-1}] = O(a_n) \qquad \text{a.s.}$$
